ÖNSÖZ

Ulusal Deniz Ölçüm ve İzleme Programı-Marmara Denizi Alt Projesi (DEBÇAG-60/G) çerçevesinde Türk Boğazlar Sistemi'ni oluşturan Marmara Denizi ve Boğazlarında 1989 yılı içerisinde ölçülen temel oşinografik ve biyokimyasal parametrelerin mevsimsel bazda değişimleri bu rapor kapsamında sunulmuştur.

Ülkemizi çevreleyen denizlerimizle ilgili temel oluşturacak ve gelecek kuşaklara oşinografik bazlı bilgi aktarımını sağlayacak bu Ölçüm ve İzleme Programı'nın gerçekleştirilmesine önyayak olan ve gerekli koordinasyonu sağlayan T.C. Başbakanlık Devlet Planlama Teşkilatı (DPT), Türkiye Bilimsel ve Teknik Araştırma Kurumu-Deniz Bilimleri ve Çevre Araştırmaları Grubu (TÜBITAK-DEBÇAG) ile Seyir, Hidrografi ve Oşinografi Hizmetleri Plan Koordinasyon Kurulu'na teşekkürü bir borç biliyoruz.

Ayrıca, söz konusu saha çalışmalarının ve ölçümlerin sağlıklı ve düzenli olarak yapılmasında, verilerin toplanmasında büyük özveri ile katkılarda bulunmuş tüm ODTÜ-Deniz Bilimleri Enstitüsü personeline ve R/V Bilim Gemisi personeline çalışmalarından dolayı teşekkür ederiz.

I. GİRİŞ

Türkiye Bilimsel ve Teknik Araştırma Kurumu (TÜBİTAK) tarafından desteklenen "Ulusal Deniz Ölçüm ve İzleme Programı-Marmara Denizi Alt Projesi (DEBÇAG-60/G)" kapsamında 1989 yılında Marmara Denizi ve Boğazlarının dinamигini kontrol eden etkenlerin belirlenmesi, Marmara 'yı çevreleyen koy ve körfezlerin mevcut kirlilik durumlarının tespiti ve bu denizimizin biyokimyasal karakterlerinin bilimsel bazda tanımlanması yönünde toplam 3 saha çalışması yapılmıştır. Bu saha çalışmalarının birincisi Şubat, ikincisi Mart, Üçüncüsü ise Eylül, 1989 ayında ODTÜ-DBE'ne ait R/V Bilim gemisiyle yapılmıştır.

Bu çalışmalarda, biyokimyasal parametreler olarak besin tuzlarından *orta-fosfat* ($\text{o-PO}_4\text{-P}$), Toplam Oksitlenmiş Azot ($\text{TN}\text{O}_{\text{m-N}}$), molibdat reaktif Silikat ($\text{Si(OH)}_4\text{-Si}$), suda çözünmüş halde bulunan organik maddeler (DOC) ve klorofil-a (CHLL-a); kirletici parametreler olarak ta Hümik Maddeler (HM), Toplam Askıda Katı Maddeler (TAK), suda çözünmüş/disperse olmuş Poliaromatik Petrol Hidrokarbonları (PAH) ve suda Toplam Civa (Hg_{w}) ölçümleri yapılmıştır. Bu parametrelerin tanımlanmasında kullanılan birimler ve kısaltmalar Çizelge-1'de sunulmuştur.

Yukarıda adı geçen biyokimyasal parametreler ile ilgili 1987-1988 dönemine ait saha bulgularının değerlendirilmesi ve yorumlanması Temmuz, 1989 da yıllık rapor olarak TÜBİTAK-DEBÇAG grubuna sunulmuştur. Şubat, Mart ve Eylül, 1989 dönemlerinde Ölçüm ve İzleme çalışmalarının yapıldığı istasyonlar, örneklemeye derinlikleri ile beraber, sırası ile, Çizelge-2, Çizelge-3 ve Çizelge-4'te; ölçümlerin yapıldığı istasyonların yer ve kod numaraları ise Şekil-1, Şekil-2 ve Şekil-3'te gösterilmiştir. Şekil 4-6'da ise tuzluluk, sıcaklık ve çözünmüş oksijenin ölçümlerinin yapıldığı istasyonların yerleri gösterilmektedir.

Şekil 1-6'da konumları verilen istasyonlar, üç ana grup altında toplanabilirler. Bunlar, sırası ile, nehir deşarjları ile evsel ve endüstriyel atıksular gibi kara kökenli kirletici kaynakların doğrudan etkisi altında kalan bölgelerdeki istasyonlar; kita sahanlığı üzerinde bulunan fakat karasal kaynaklardan dolaylı olarak etkilenen kıyı istasyonları; toplam su derinliği 200 metreden daha fazla olan açık-deniz istasyon-larıdır. Birinci grupta İzmit (İst.M5 ve M6), Gemlik (İst.M17 ve M18) ve Bandırma (İst.M31, M32) körfezlerindeki istasyonlar sayılabilir.

1989 yılı I. Dönemine ait fiziksel ve kimyasal bulgular IBM disketlerinde I. Dönem Bulgu Raporu kapsamında TÜBİTAK-DEBÇAG grubuna daha önce sunulmuştur. Söz konusu Bulgu Raporu kapsamında verilmeyen Eylül, 1989 bulguları bu rapor kapsamında disketler halinde sunulmuştur.

II. 1989 DÖNEMİ BULGULARININ DEĞERLENDİRİLMESİ

II.1. BİYOKİMYASAL VE FİZİKSEL BULGULAR:

"Ulusal Deniz Ölçüm ve İzleme Programı- Marmara Denizi Alt Projesi (DEBÇAG-60/G) kapsamında 1989 yılı içinde ölçümlü yapılan kimyasal bulgular, Şubat, 1989 dönemi için Çizelge-5, Mart, 1989 için Çizelge-6 ve Eylül, 1989 dönemi için ise Çizelge-7'de sunulmuştur. Aynı dönemler içinde yerinde ölçümlü yapılan tuzluluk, sıcaklık ve çözünmüş oksijen değerleri ise, sırası ile, Çizelge-8, Çizelge-9 ve Çizelge-10'da istasyon bazında, standart derinliklerde sunulmuştur.

Çizelgelerin incelenmesinden, bir geçiş denizi özelliği gösteren Marmara Denizi Üst tabaka sularının kalınlığının mevsimsel ölçekte değiştiği, kış sonuna doğru (Şubat-Mart) hakim rüzgarların sebep olduğu düşey karışım sonucunda, Üst tabaka sularının tuzluluğunun yaz dönemine (22-23 ppt) oranla

arttığı (24-26 ppt) görülmektedir. Marmara Denizi alt tabaka sularının ($>150m$) ise mevsimsel değişikliklerden etkilenmediği, nisbeten sabit sıcaklıkta ($14.40-14.50^{\circ}\text{C}$) ve tuzlulukta ($=38.55$) olduğu aynı çizelgelerin incelenmesinden anlaşılmaktadır.

Alt tabaka suları içinde ve bilhassa birincil yoğunluk (primary pycnocline) tabakalaşmasının hemen altında yer alan su kütlesi içinde önemli miktarlarda bakteriyolojik parçalanmaya uğrayan karasal ve denizsel kaynaklı organik maddeler, anorganik bileşenlerine ve daha fazla bakteriyolojik parçalanmaya dirençli organik maddelere dönüşmektedir. Organik maddenin bakteriyolojik parçalanması esnasında ise suda çözülmüş halde bulunan oksijen tüketilmekte, zaman zaman tehlike sınırlarının altına inebilmektedir.

Şekil-7'de Marmara'nın doğu baseni Üzerinde bulunan M9 nolu istasyonda 1989 döneminde farklı aylarda ölçülen oksijen profilleri verilmiştir. Bu profillerin incelenmesinden, Ağustos, 1989'da yoğunluk tabakalaşmasının hemen altında bulunan suların 0.5 mg/l den daha az oksijen içerdiği görülmektedir. Aynı dönemde derin suların içerdiği oksijen miktarı $1.0 \text{ mg/l}'den fazladır. Yaz döneminin sonlarında esmeye başlayan kuvvetli poyraz rüzgarları, yoğunluk arakesitin karaya doğru yükselmesine ve bu bölgenin tabanına yakın yaşayan bentik ve demersal canlıların oksijeni çok az olan bu tabaka sularının etkisinde kalmasına ve dolayısıyle oksijensizlikten ölmelerine neden olmuştur. Şiddetli esen bu rüzgarların olumlu etkisi ise arakesit Üzerinde yarattığı karışımından dolayı oksijeni $0.5 \text{ mg/l}'ye düşmüş bulunan suların yeniden oksijenlenmesidir. Ekim, 1989 da bölgede ölçülen oksijen değerlerinden (bkz. Şek.7) anlaşılmaktadır.$$

Yaz dönemi boyunca alt tabaka suları içinde birikime uğrayan besin tuzları, kış dönemlerinde dikey karışımlarla üst tabaka sularına geri gönderilmektedir. Bu artışlar Çizelge-5 ve

Çizelge-6'dan kolayca görülebilmektedir. Bunun sonucunda, fotik bölge sularının besin tuzu konsantrasyonları artmakta ve bahar döneminde planktonların kullanımına hazır hale getirilmektedir.

Marmara Denizi derin basenleri boyunca besin tuzlarının düşey değişimleri Şubat, Mart ve Eylül, 1989 dönemleri için Şekil-8 de gösterilmiştir. Besin tuzlarının düşey değişimlerinin incelenmesinden, Üst tabaka sularının (0-30m) içерdiği besin tuzu miktarlarının mevsimsel ölçekte değiştiği görülmektedir. Alt tabaka sularının içерdiği besin tuzu miktarları ise derine doğru gidildikçe artmaktadır. Marmara Denizi alt tabaka suları 1.2-1.4 μM fosfat iyonu, 9.0-11.0 μM $\text{NO}_x\text{-N}$ ve 45-50 μM silikat içermektedir. Bu tabaka sularına en önemli besin tuzu girdisi Üst tabaka içinde planktonlarca oluşturulan partikül haldeki organik maddeler ile, bu tabakaya değişik karakterdeki atıksuların getirdiği organik maddeler yoluyla olmaktadır.

Marmara Denizi'nin Çanakkale Boğazı ile birleştiği bölgede ise (İst. M46), bölge sularının dinamik yapısına bağlı olarak meydana gelen yatay ve düşey karışımalar süreklilik gösterebilmekte, buna bağlı olarak Marmara Denizi derin basenleri boyunca gözlenen besin tuzlarının iki tabaklı yapısı nisbeten daha az belirgin olmaktadır. Şubat, 1989 döneminde görüldüğü gibi tüm su kolonu besin elementleri açısından homojen bir yapı gösterebilmektedir.

II.2. KIRLETİCİ PARAMETRELER

1989 yılı Ulusal Oşinografi Programı kapsamında Marmara Denizi'ni çevreleyen, potansiyel kirletici ve kirletilmiş bölgeler olarak bilinen İzmit, Gemlik ve Bandırma Körfezleri ile turizm faaliyetlerinin yoğun olduğu Erdek Körfezi sularında HM, TAK, PAH ve Hg_w ölçümleri yapılmış, elde edilen değerler derlenerek Çizelge-11-13'te sunulmuştur.

Çizelgelerin incelenmesinden, fosfat iyonu açısından en fazla kirletilmiş körfezin Bandırma Körfezi olduğu görülmektedir. Şubat, 1989 döneminde Marmara Denizi Üst tabaka sularının içeriği $\text{PO}_4\text{-P}$ miktarı $0.3\text{-}0.4 \mu\text{M}$ mertebesinde iken, Bandırma Körfezi'nde bu değer $6.77 \mu\text{M}$, İzmit Körfezi'nde ise $0.80 \mu\text{M}$ olarak bulunmuştur. 1987-1988 döneminde yapılan ölçümlerde de, aynı körfezlerin fosfat iyonu bakımından en fazla kirletilmiş bölgeler olduğu belirtilmiştir. Her iki körfez sularının tüm izleme çalışmalarında yüksek miktarlarda fosfat iyonu içermesi, bu bölge sularının çevrede kurulu gübre fabrikalarının atıksularından fazlaıyla etkilendiğini, bu bölgelerdeki su hareketlerinin sınırlı ve yenilenme zamanının uzun olmasından kaynaklandığı düşünülmektedir. En yüksek civa değerlerine (Şubat ayında 12.8 ng/l ; Mart ayında ise 8.6 ng/l) yine bu körfezlerde rastlanılması tesadüf değildir.

Geçmiş dönemlerde yapılan çalışmalarda azotlu bileşiklerce kirletildiği belirlenen Gemlik Körfezi'nin 1989 dönemi içinde Marmara Denizi genelinden farklı değerler göstermediği, ölçülen değerlerin mevsim normalleri içinde bulunduğu anlaşılmıştır. Bu azalmanın nedeni, tam olarak bilinmemekle beraber, körfeze yapılan atıksu deşarjlarındaki azalmadan veya körfez sularının 1989 yılı içinde daha etkin olarak yenilenebilmesi olabilir.

**Çizelge 1: Marmara Denizi'nde Ulusal Deniz Ölçme ve İzleme Programı
kapsamında izlenen kimyasal parametreler**

Parametre	Sembol	Birim	Analiz Yöntemi
Besin Tuzları:			
orto-fosfat fosforu	O-PO ₄ -P	µg-at P/l	1
Toplam Oksitlenmiş Azot (NO ₃ ⁻ +NO ₂ ⁻)	TO _x N-N	µg-at N/l	1
